

Heredity II

Objectives

- Describe the inheritance pattern of monohybrid and dihybrid crosses in *Arabidopsis thaliana*.

Stages

Mitosis: A specific stage in the cell cycle where somatic cells divide, resulting in two identical diploid daughter cells.

Meiosis: The process by which sex cells divide, resulting in four haploid gametes.

Independent Assortment

Key

- Maternal set of chromosomes
- Paternal set of chromosomes

For each pair of chromosomes, maternal and paternal homologues are sorted into daughter cells independently of the other pairs

Dominant vs Recessive

- **Dominant traits** are those that are inherited unchanged in a hybridization (F1).
- **Recessive traits** become latent, or disappear, in the offspring of a hybridization (F1).
- The recessive trait does, however, reappear in the progeny of the hybrid offspring (F2).

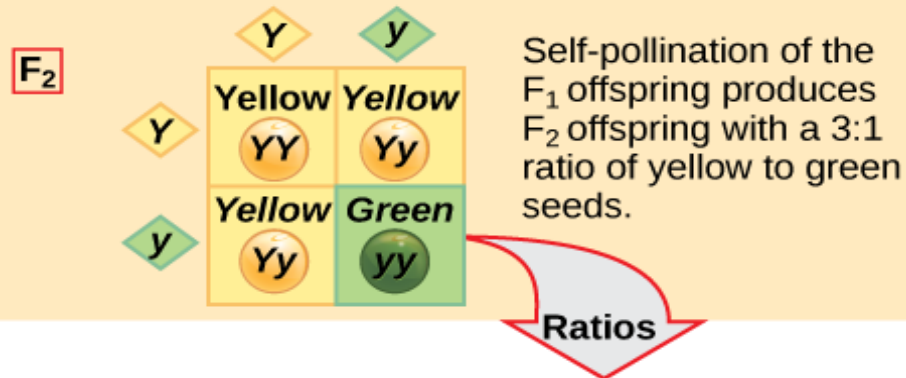

Mendelian Crosses

- Mendel crossed plants that were true-breeding for violet flower color with plants true-breeding for white flower color (the P generation). Homozygous.
- The resulting hybrids in the F₁ generation all had violet flowers. One of the two alleles must be dominant.
- In the F₂ generation, approximately three quarters of the plants had violet flowers, and one quarter had white flowers. Expected with a dominant and recessive allele in the F₁.

Monohybrid Cross

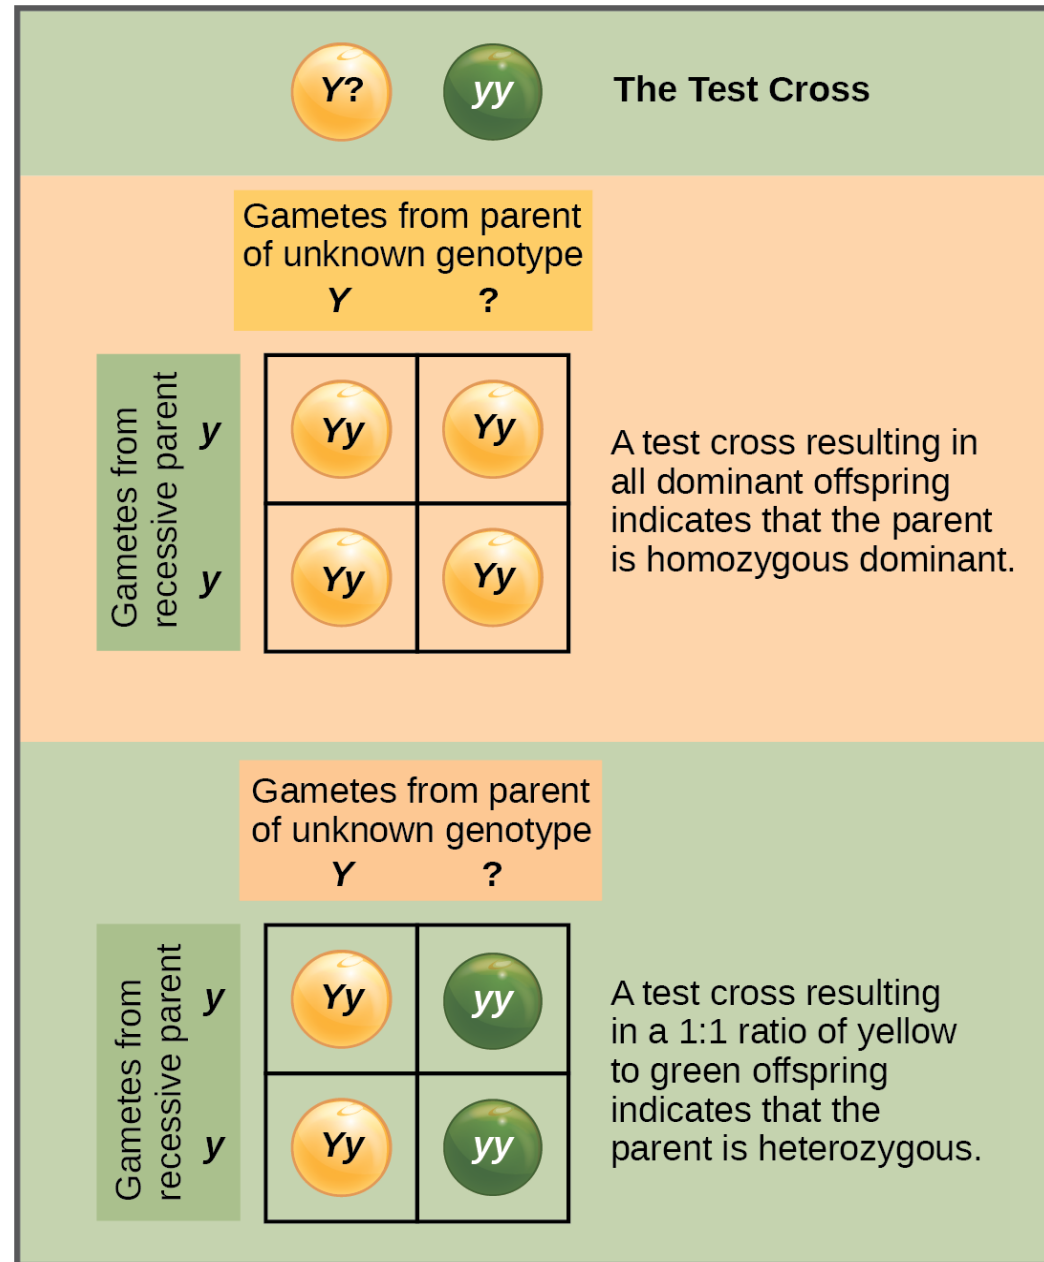

Phenotypes	Genotypes	Genotype ratio	Phenotype ratio
Yellow	YY Yy	1 2	3
Green	yy	1	1

Punnett square

- All possible combinations of the parental alleles are listed along the top (for one parent) and side (for the other parent) of a grid, representing their meiotic segregation into haploid gametes.
- Combinations of egg and sperm are made in the boxes in the table to show which alleles are combining.
- Each box represents the diploid genotype of a zygote, or fertilized egg, that could result from this mating.

Test Cross

- In pea plants, round peas (R) are dominant to wrinkled peas (r).
- You do a test cross between a pea plant with wrinkled peas (genotype rr) and a plant of unknown genotype that has round peas (genotype RR or Rr).
- You end up with three plants, all which have round peas. From this data, can you tell if the round pea parent plant is homozygous dominant or heterozygous

Dihybrid Cross

- The independent assortment of genes can be illustrated by the dihybrid cross, a cross between two true-breeding parents that express different traits for two characteristics.
- Because each parent is homozygous, the law of segregation indicates that the gametes for the green/wrinkled plant all are yr, and the gametes for the yellow/round plant are all YR. Therefore, the F₁ generation of offspring all are YyRr.

Expectation vs Reality

- The chance of seeing Green Wrinkled Peas = $1/16$
- The chance of **NOT** seeing Green Wrinkled Peas = $15/16$
- If we look at 10 plants then
- $(15/16)^{10} = 0.52$ ~52% of NOT seeing Gr. Wr. Peas
- If we look at 60 plants then
- $(15/16)^{60} = 0.02$ ~2% of NOT seeing Gr. Wr. Peas

Heredity I: *Observe the plants, note What's different*

- *gl1* – glabrous (bald) phenotype
- *gl2* – trichomes phenotype
- *gfp1* – fluorescent
- *gfp2* - non-fluorescent

plants expressing
gfp glow green
under blue light,
whether or not they
are hairy

Plants without
gfp appear as
dim gray shapes
under blue
light

Phenotypes

gl2,gl2/gfp1,gfp1

gl1,gl1/gfp2,gfp2

P Generation

gl1,gl2/gfp1,gfp2

Glowing and Hairy

F1 Generation

Gametes from heterozygous parents
gl2/gfp1 | gl1/gfp1 | gl2/gfp2 | gl1/gfp2

Gametes from heterozygous parents
gl1/gfp2 | gl2/gfp2 | gl1/gfp1 | gl2/gfp1

F2 Generation
Phenotypes:

9 : 3 : 3 : 1
